

# Centralized power usage

## How to choose a centralized power supply

We can roughly estimate how much power a centralized power source needs based on the number of devices. Take G65 as an example, if you want a centralized power supply to supply power to 9 G65 devices. The maximum power of a single G65 is about 100W, and the required power for 9 units is:  $100 \times 9 = 900W$ .

In order to ensure stable power supply, it is strongly recommended to use the centralized power supply provided by the manufacturer.

## Centralized power connection

Make sure that the positive and negative connections are as follows (for reference only, please refer to the device description):
